ABSTRACT

The project “**Online Grievance Redressal System For An Educational Institution**” is aimed to develop to maintain the student is easily found out the information in website .Student/staff of the institution can lodge complaint through the system by registering in the website.After successful registration of the complaint, the user will get a complaint ID (acknowledgment number) for the future reference.

The admin can view all the complaints in the website.The head of department can view department complaint in the website.The admin will verify the authenticity of the complaint of this category.

The complaint through effective action send reply to the complainant with supporting files, if any .Once the complaint is resolved, he/she can view reply to the grievance posted.The complainants redressed will be shown as closed and the complainants can reopen the case if they are not satisfied with the solution or action taken on their grievance. The admin of the grievance to the next level investigation.

CHAPTER 1

INTRODUCTION

The project **“Online Grievance Redressal System For An Educational Institution”** is aimed to develop to maintain the student is easily found out the information in the website. The system details upload information is student details, staff details, supplier details, student complaint details and etc. The system is design the main purpose of this study is to put to an end the difficulties students encountered when checking their information about the library and notification details in the website. This is actualized by designing computerized online help desk services which is user friendly and interactive. By the time this software is designed and implemented, the difficulties encountered with manual method of checking customer’s information will be eliminated. The aims and objectives of this project are listed below:

- To develop software called online help desk services that will replace the manual method.
- To maintain an efficient system of college details in the website.
- To eliminate the error involved with the manual method of search the information.
- To save the time waste with manually method of the student’s are upload the complaint details and view the library details , exam details and lab facilities in the website.

CHAPTER 2

ORGANIZATION PROFILE

Integrity Solutions specializes in offering our customers total web solutions. As a Privately owned and funded startup, we have been building our business with a strong commitment to deliver IT solutions in time. We are working towards development of innovative and creative products, services and concepts providing total information. We pride ourselves in being a fast developing firm **Integrity Solutions** possesses the best of the skills and wide spread expertise in proposing, designing, developing, and implementing such solutions in diversified technologies and platforms. Experts, who are fastidiously chosen, continuously trained and nurtured through a specially designed recruitment and retention program.

Integrity Solutions is a professional IT services company that contributes to the success of its clients by creating value and quality in every project. Our demonstrated performance in the areas of software development, project management, staffing augmentation and personalized training is documented through long-term, time-built relationships with our clients, which are based on confidence and trust.

DEVELOPEMENT

Integrity Solutions Solutions is a leading consulting and IT services company, offering a wide array of solutions customized for a range of key verticals and horizontals **Integrity Solutions** was established by a group of professionals and technocrats, having rich experience in software development, providing web based IT solutions, project management and IT management. **Integrity Solutions** works using an excellent team of young, energetic, qualified professionals under the supervision and guidance of an experienced management team. Now our team strength is around ninety three qualified professionals. We have a unique business model, where learning solutions and software development complement each other. Today the two sides of our business are almost equally balance

CHAPTER 3

SYSTEM CONFIGURATION

3.1 HARDWARE REQUIREMENTS

Processor : Intel core i3

RAM : 4 GB

Hard disk : 320 GB

3.2 SOFTWARE REQUIREMENTS

Operating System :Windows 10

User Interface Design : HTML ,CSS,JAVASCRIPT

Back End :MYSQL 5.1.36

Server Side Script :PHP 8.0

Tool :Wampserver

Web Browser :Chrome

CHAPTER 4

SOFTWARE FEATURES

4.1 FRONT END

PHP:Hypertext Preprocessor(the name is a recursive acronym) is a widely used ,general-purpose scripting language that was originally designed for web development to produce dynamic webpage.For this purpose,PHP code is embedded into the HTML source document and interpreted by a web server with a PHP processor module,which generates the web page document.As a general purpose programming language.PHP code is processed by an interpreter application in command line mode performing desired operating system operations and producing program output on its standard output channel.It may also function as a graphical application.PHP is available as aprocessor for most modern web servers and as standalone interpreter on most operating systems and computing platforms.PHP was originally created by Rasmus Lerdorf in1995 and has been in continuous development ever since.The main implementation of PHP is now produced by the PHP group and serves as the de facto standard for PHP as there is no formal specification.PHP is free software released under the PHP License,which is incompatible with the GNU General Public License(GPL)because restrictions exist regarding the use of the term PHP.Hypertext refers to files linked together using hyperlinks,such as HTML(Hypertext Markup Language)file.Preprocessing is executing instructions that modify the output Below is a demonstration of the difference between HTML and PHP files.

Accessing an HTML page

1. Your browser sends a request to that web page's server (computer) for the file (HTML or image) you wish to view.
2. The web server (computer) sends the file requested back to your computer.
3. Your browser displays the file appropriately.
4. If you request a PHP file (ends with ".php"), the server handles it differently.

Accessing an PHP Page

1. your browser sends a request to that web page's server for the PHP file you wish to view.
2. The web server calls PHP to interpret and perform the operations called in the PHP script.
3. The web server sends the output of the PHP program back to your computer.
4. Your browser displays the output appropriately.

Benefit of PHP

Because the server does processing, the output of PHP files changes when its input changes. For example, most of the pages on the Horticulture site have only two (2) PHP commands.

1. Include the header file that defines the links on the left, the banner, and the quick links at the top.

2.Include the footer file that displays the mission statement and Horticulture contact information.

Syntax

The PHP interpreter only executes PHP code within its delimiters. Anything outside its delimiters is not processed by PHP (although non-PHP text is still subject to control structures described in PHP code). The most common delimiters are `<?php` to open and `?>` to close PHP sections, `<script language="PHP">` and `</script>` delimiters are also available, as are the shortened forms `<?or<?=(` (which is used to echo back a string or variable) and `?>` as well as ASP-style short forms `<%` or `<%` and `%>`. While short delimiters are used, they make script files less portable as support for them can be disabled in the PHP configuration, and so they are discouraged. The purpose of all these delimiters is to separate PHP code from non-PHP code, including HTML.

Datatypes

PHP stores whole numbers in a platform dependent range, either a 64-bit or 32-bit signed integer equivalent to the C-language long type. Unsigned integers are converted to signed values in certain situations; This behavior is different from other programming languages. Integer variables can be assigned using decimal (positive and negative), octal, and hexadecimal notations. Floating point numbers are also stored in a platform-specific range. They can be specified using floating point notation, or two forms of scientific notation. PHP has a native Boolean type that is similar to the native Boolean type in Java and C++. The null data type represents a variable that has no value. The only value in the null data type is NULL. PHP also supports strings, which can be used with single quotes, double quotes, nowdoc or heredoc syntax.

Functions

PHP has hundreds of base functions and thousands more via extensions. These functions are well documented on the PHP SITE" however, the built-in library has a wide variety of naming conventions and inconsistencies. PHP currently has no functions for thread programming although it does support multi-process programming on POSIX systems.

4.2 BACK END

MYSQL is the world's most used open source relational database management system(RDBMS) as of 2008 that run as a server providing multi-user access to a number of databases. The MYSQL development project has made its source code available under the terms of the GNU General Public License, as well as under a variety of proprietary agreements. MYSQL was owned and sponsored by a single for-profit firm, the Swedish company MYSQL AB, now owned by Oracle Corporation.

Mysql is a popular choice of database for use in web applications, and is central component of the widely used LAMP open source web application software stack—LAMP is an acronym for "Linux, Apache, MySQL, perl/PHP/Python." Free-software -open source projects that require a full-featured database management system often use MYSQL.

MYSQL is also used in many high-profile, Large scale World Wide Web products, including Wikipedia, Google (though not searches), Imagebook, Twitter, Nokia.com and Youtube.

Command Line

MYSQL ships with some command line tools. Third -parties have also developed tools to manage a MYSQL server, some listed below.

MYSQL works on many different system platforms, including AIX, BSDi, FreeBSD, HP-UX, ecomstation, i5/os, IRIX, Linux, Mac OS X, Microsoft windows. A port of MYSQL to OpenVMS also exists.

MYSQL is written in C and C++. Its sql parser is written in yacc, and a home-brewed lexical analyzer. These include MYSQL Connector/Net for integration with Microsoft's Visual

studio(languages such as C# and VB are most commonly used.) and the JDBC driver for java. The HTSQL-URL -based query method also ships with a MYSQL adapter, allowing direct interaction between a MYSQL database and any web client via structured URLs.

Features

As of April 2009, MYSQL offered MYSQL 5.1 in two different variants: the open source MYSQL Community Server and the commercial Enterprise Server. MYSQL 5.5 is offered under the same licenses. They have a common code base and include the following features:

- A broad subset of ANSI 99, as well as extensions
- Cross- platform support
- Stored procedures
- Triggers
- Cursors
- Updatable views
- Information schema
- Strict mode(ensure My SQL does not truncate or otherwise modify data to conform to an underlying data type, when an incompatible value is inserted into that type)
- X/Open XA distributed transaction processing (DTP) support.
- Transaction with the InnoDB, and cluster storage engines; savepoints with InnoDB SSL support
- Query caching
- Sub-SELECTs)
- Full_text indexing and searching using MYISAM engine.
- Embedded database library.
- Unicode support(however prior to 5.5.3 UTF-8 and UCS-2 encoded strings are limited to the BMP in 5.5.3. and later use utf8mb4 for full Unicode support)
- ACID compliance when using transaction capable storage engines (InnoDB and Cluster)
- Partitioned tables with pruning of partitions in optimizer.
- Shared-nothing clustering through MYSQL Cluster.
- Hot backup(via mysqlhotcopy) under certain conditions.

CHAPTER 5

PROJECT DESCRIPTION

5.1 OVERVIEW OF THE PROJECT

In existing system the information is very difficult to retrieve and to find particular information. The user has to go through various registers. This results in inconvenience and wastage of time. The information generated by various transactions takes time and efforts to be stored at right place. Manual calculations are error prone and take a lot of time this may result in incorrect information. For example the student's are going to the library and checking to the book details, This becomes a difficult task as information is difficult to collect from various registers. The proposed system is designed with motive of the user easily find the helping line details in the website. The admin can update the staff details, student details and view the student complaints details in the notification box of the website. These details are stored in the database. The users are easily finding the information of the system. And then user can view the lab and library details in the website. And upload the complaints in the system and view answer of the complaint details. So the student are easily view our college details in the website. The system can display the details about the college location, address, facilities and etc.

5.2 PROBLEM STATEMENT

Our system can be used to automate the work flow of service requests for the various facilities available in the college campus. This is an integrated system that covers different kinds of sections/departments such as student sections, accounts department, exam sections, labs, departmental offices etc. Registered users i.e. students will log in to request for

service of any of the supported facilities. The different requests will be sent to the concerned facility heads, who are also valid users of the system, who fulfill the requests. Then the registered users will be noticed through the email notification about the status of their request. Students can easily request for different services via this online portal. So the students can easily find out any information of the college website.

5.3 MODULE DESCRIPTION

1. REGISTRATION

2. COMPLAINT

3. REPORT

1. REGISTRATION MODULE

1.1. Student registration

There is a registration form available where a student can create their account by providing required information to the system. The registration form details are like student name, email id, gender, phone number, address, and etc. These details are stored in the database and then can be getting to the username and password in the system.

1.2. Staff registration

There is a registration form available where staff can create their account by providing required information to the system. The registration form details are like staff name, email id, gender, phone number, adhar no, address, and etc. These details are stored in the database. And then can be getting to the username and password in the system.

1.3.Supplier registration

There is registration form available where supplier can create their account by providing required information to the system. The registration form details are like supplier name,email,gender,phone number,adhar no,address,and etc. These details are stored in the database.And then can getting to the username and password in the system.

2.COMPLAINT MODULE

2.1.Complaint registration

The complaint registration by the student ,staff,supplier register.the admin can View all the complaints.

2.2.View the complaint

The admin can view all the student ,staff,supplier complaint information's in the portal.

2.3. Update the complaint

The admin can update the status of the student, staff, supplier complaint.The complaint solution is viewed by the student ,staff and supplier.

3.REPORT MODULE

3.1.Studentwisereport

This report gives you an overview of all the student basic details such as student id, student name ,gender ,dob , phone no, regno , department etc.

3.2.Staffwise report

This report gives you an overview of all the staff basic details such as staff id ,staff name ,Gender, phone no , department,designation etc.

3.3.Supplierwise report

This report gives you an overview of all the student basic details such as supplier id, supplier name ,gender,aadhar no , phone no, address etc.

3.4. Complaintwisereport

The complaint wise reports give the information of complaints according to the complaint type given.

3.5.Monthwisereport

Month wise reports give the information depict the up to date information about the current status of various records.The various types of reports that will be generated.

CHAPTER 6

SYSTEM ANALYSIS

6.1 EXISTING SYSTEM

The existing system is a system that is carried out in terms of manual operation. A system in which all the methods of checking students information is of a manual approach. Critical analysis of this system reveals that it is a system prone to a lot of errors and it is not effective. Searching for somebody's information is time consuming and boring. Careful analysis also shows that because of the complexities of the manual system, information stored is difficult to retrieve. Also because of the inconsistency of the manual system, at times files and items are lost because of mismanagement. Another problem of this manual method of checking student's information is prone to attack by fraudulent

6.1.1 DRAWBACKS OF EXISTING SYSTEM

- Prone to fraudulent attack
- Data redundancy.
- Time wasted in checking student's information ,searching/sorting for information.
- Poor security and protection
- Misplacing and mismanaging of pupils data

6.2 PROPOSED SYSTEM

The current facilities/services of a campus such as requesting for documents, certificates, permissions etc. are fulfilled manually which takes a lot of time. The aim of our project is to develop an online grievance system for the facilities available in the college campus. This is a web application that can be accessed throughout the campus. Our system can be used to automate the work flow of service requests for the various facilities available in the college campus. This is an integrated system that covers different kinds of sections/departments such as student sections, accounts department, exam sections, labs, departmental offices etc. Registered users i.e. students will log in to request for service of any of the supported facilities. The different requests will be sent to the concerned facility heads, who are also valid users of the system, who fulfill the requests. Then the registered users will be noticed through the email notification about the status of their request. Students can easily request for different services via this online portal. The corresponding facility heads will then take necessary actions and try to fulfill the requests.

6.2.1 ADVANTAGES OF PROPOSED SYSTEM

- The benefits for students with access to their incidents and the ease with which they can track progress.
- The students can use the helpdesk forum for different queries they have and interact with other students.
- The head can use the send mail function and notify the student about the status of his request.

CHAPTER7

SYSTEM DESIGN

7.1 UML DIAGRAM

7.1.1 USE CASE DIAGRAM

Usecase diagram can be used to describe the functionality of a system in a horizontal way.

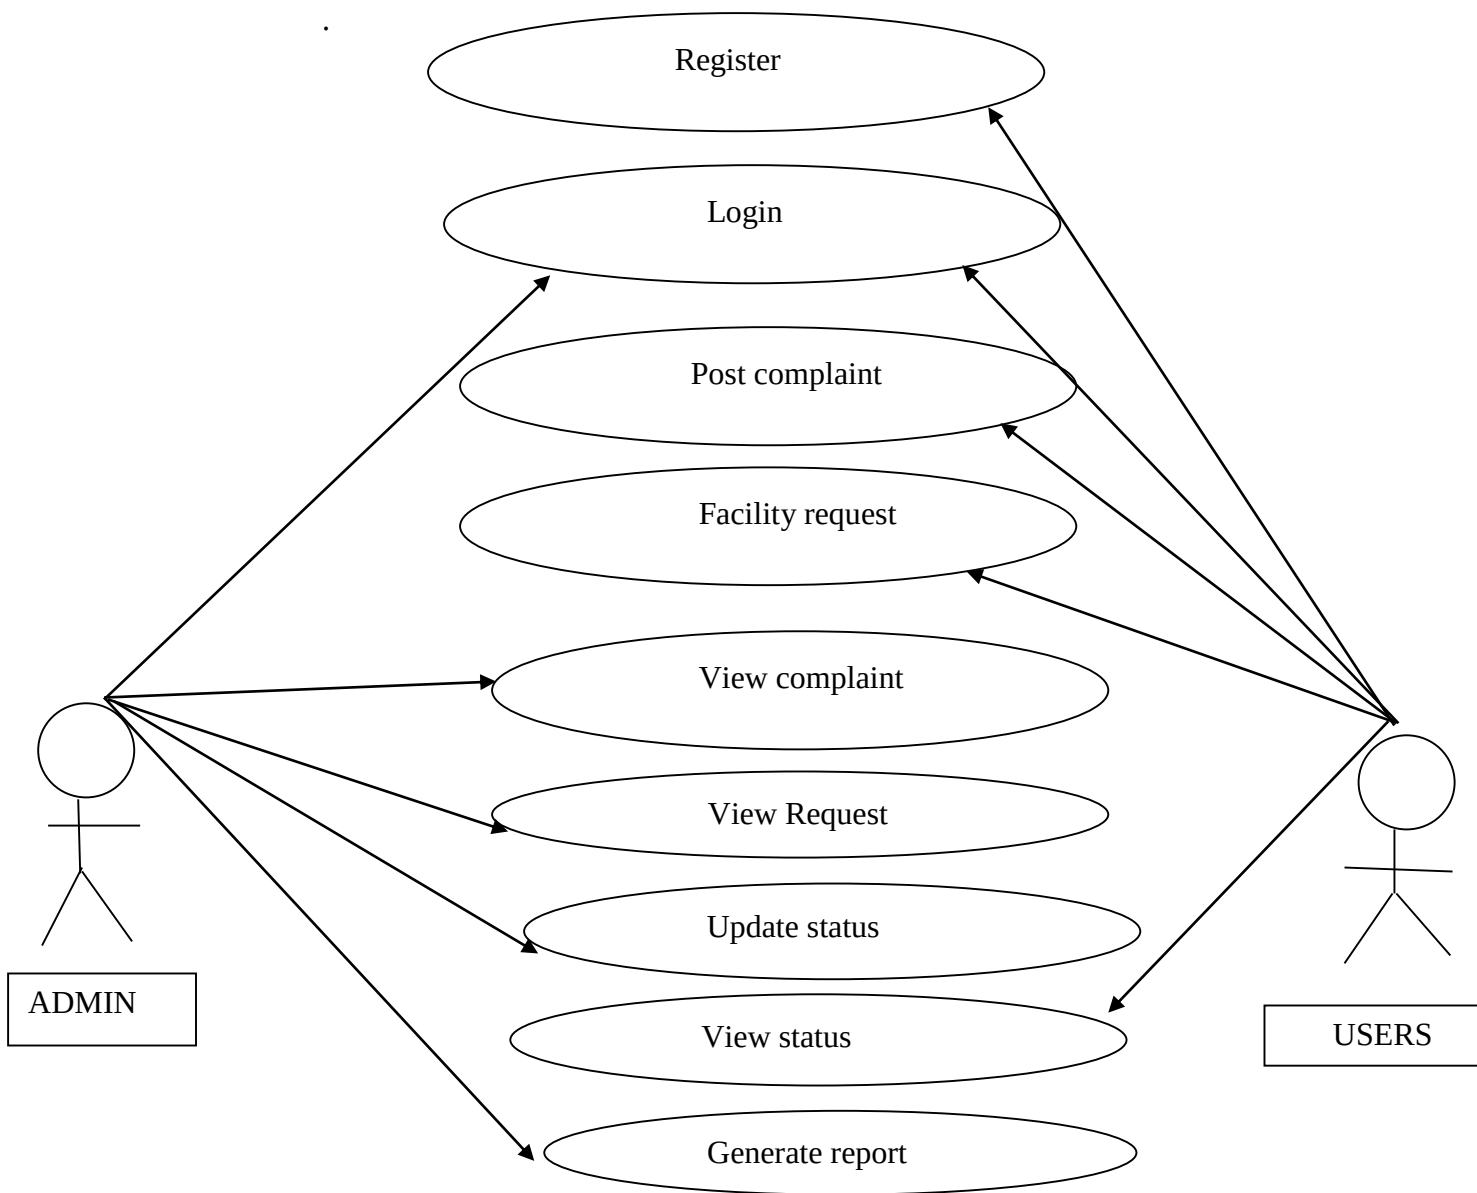

Fig.No.7.1.1Use case Diagram for Grievance Redressal system

7.1.2 CLASS DIAGRAM

The following class diagram includes the modules such as admin,users,complaint details

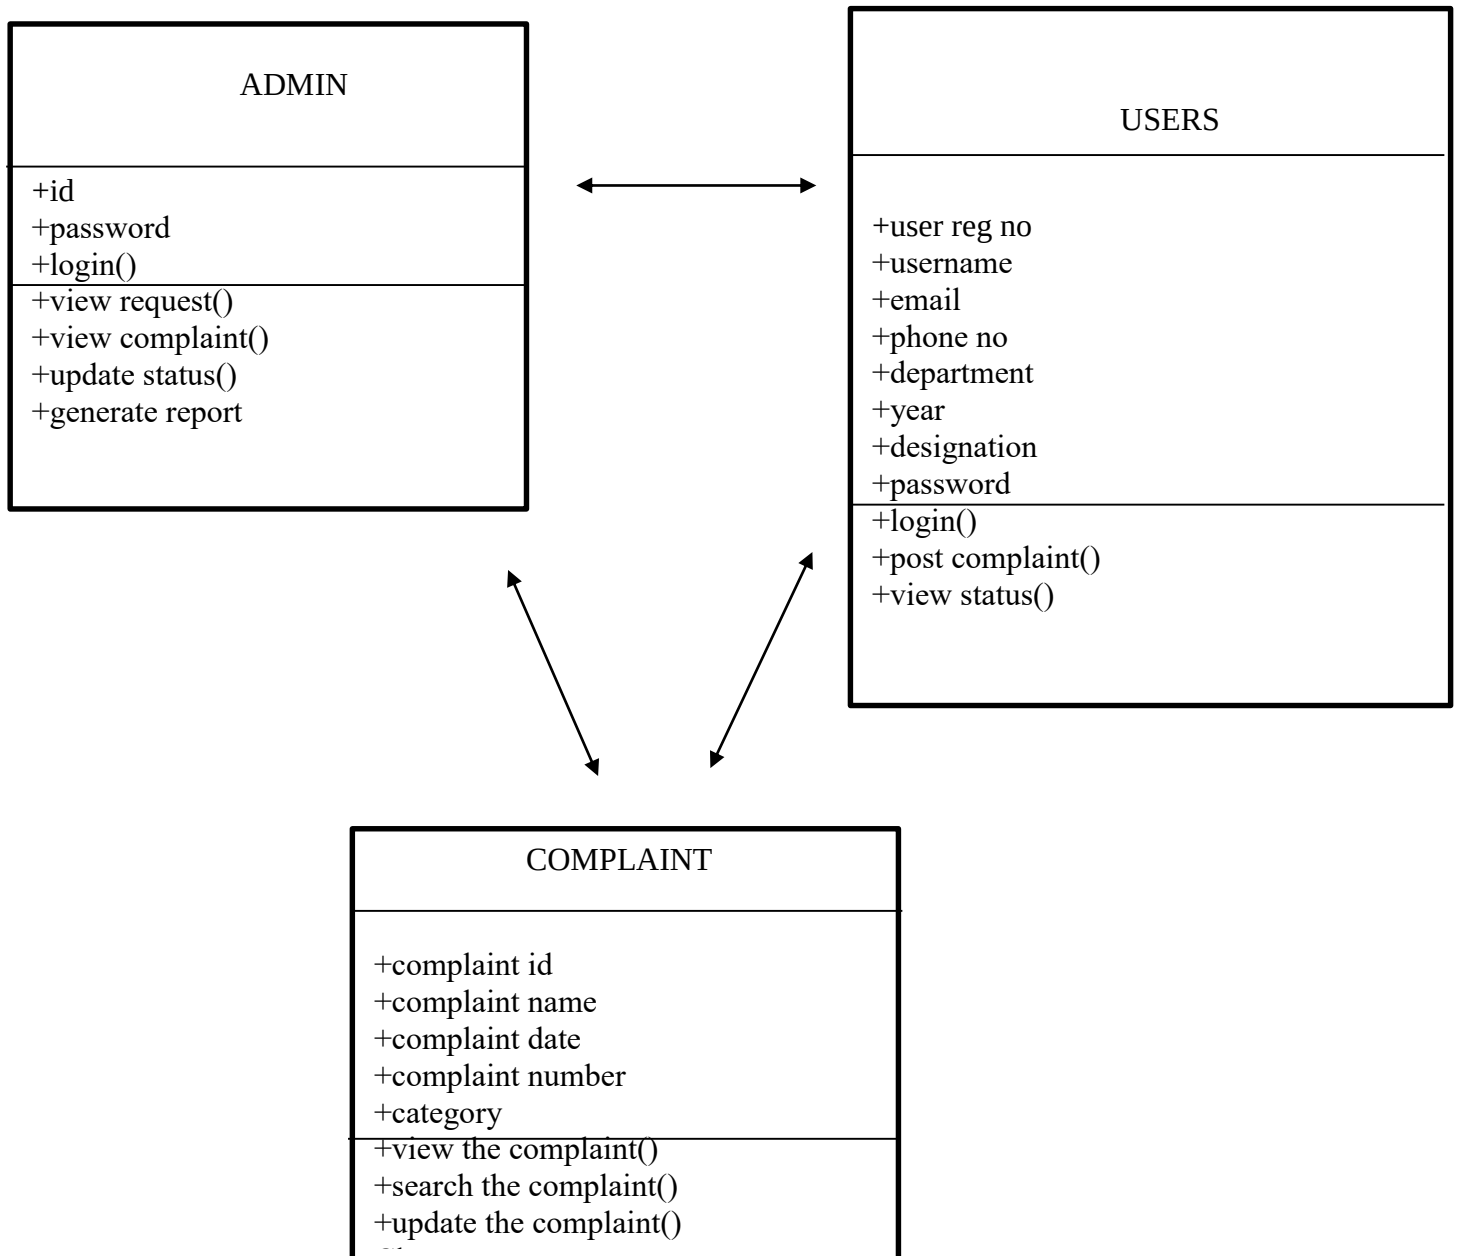

Fig.No. 7.1.2 Class diagram for Grievance Redressal system

7.1.3 ACTIVITY DIAGRAM

Activity diagram displays a special state diagram ,where most of the state are action states and most of the transistions are triggered by completion of the action in the source states.The activity can be described as an operation of the system.So the control flow is drawn from one operation to another.This flow can be sequential,branched or concurrent.Activity diagrams deals with all type of flow control by using different elements.

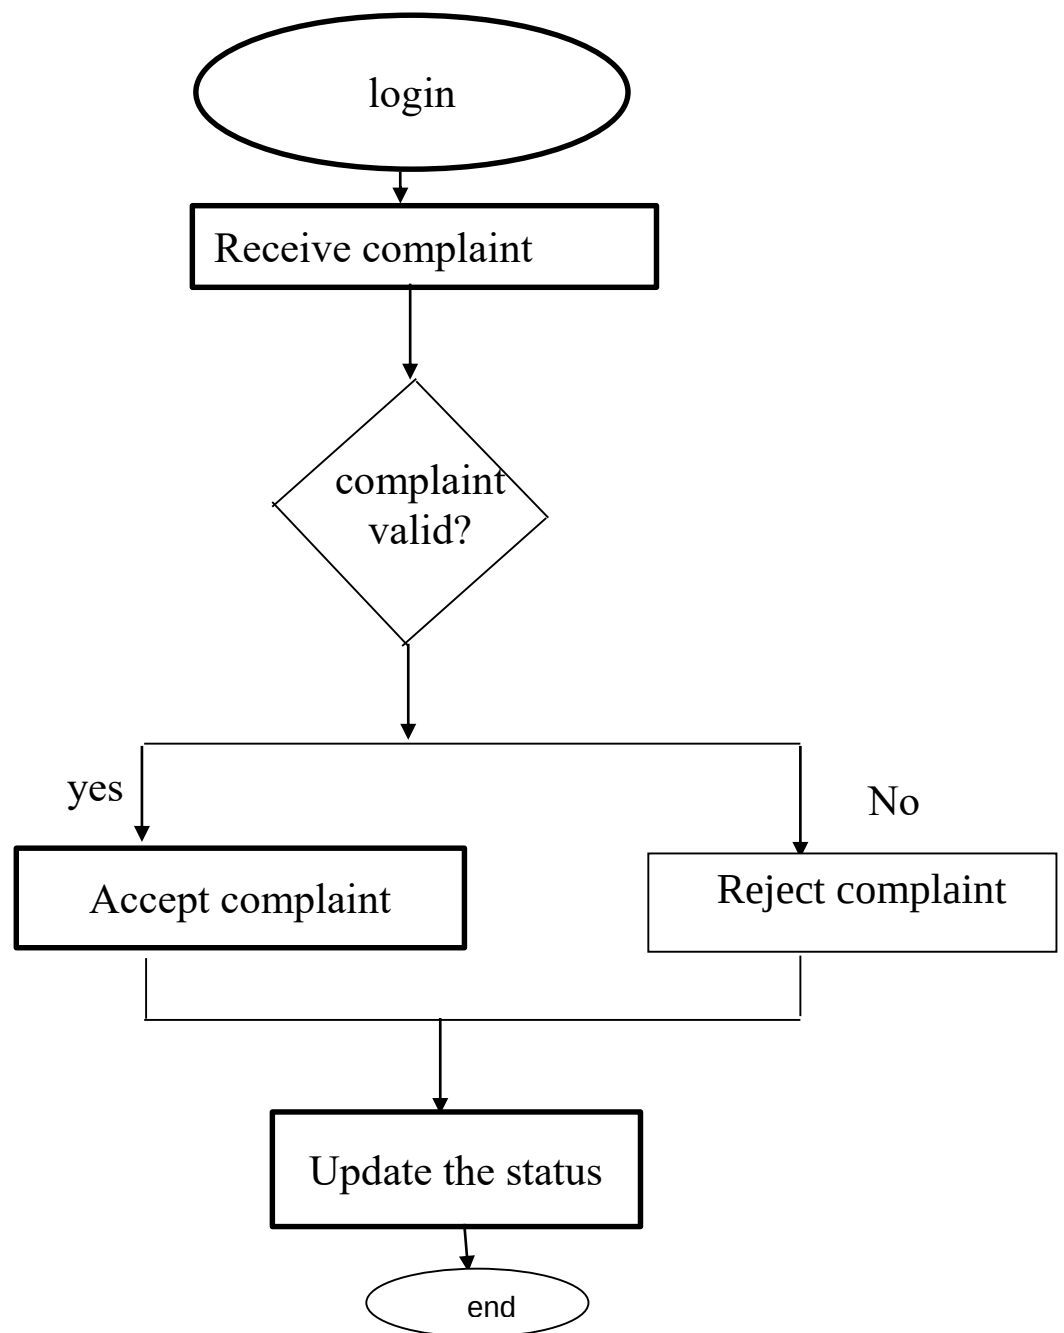

Fig.No. 7.1.3 Activity Diagram for Grievance redressal system

7.1.4 SEQUENCE DIAGRAM

A Sequence diagram shows object interactions arranged in time sequence. It depicts the objects and classes involved in the scenario and the sequence of messages exchanged between the objects needed to carry out the functionality of the scenario. Sequence diagrams are typically associated with usecase realizations in the Logical view of the system under development, sequence diagrams are sometimes called event diagrams or event scenarios.

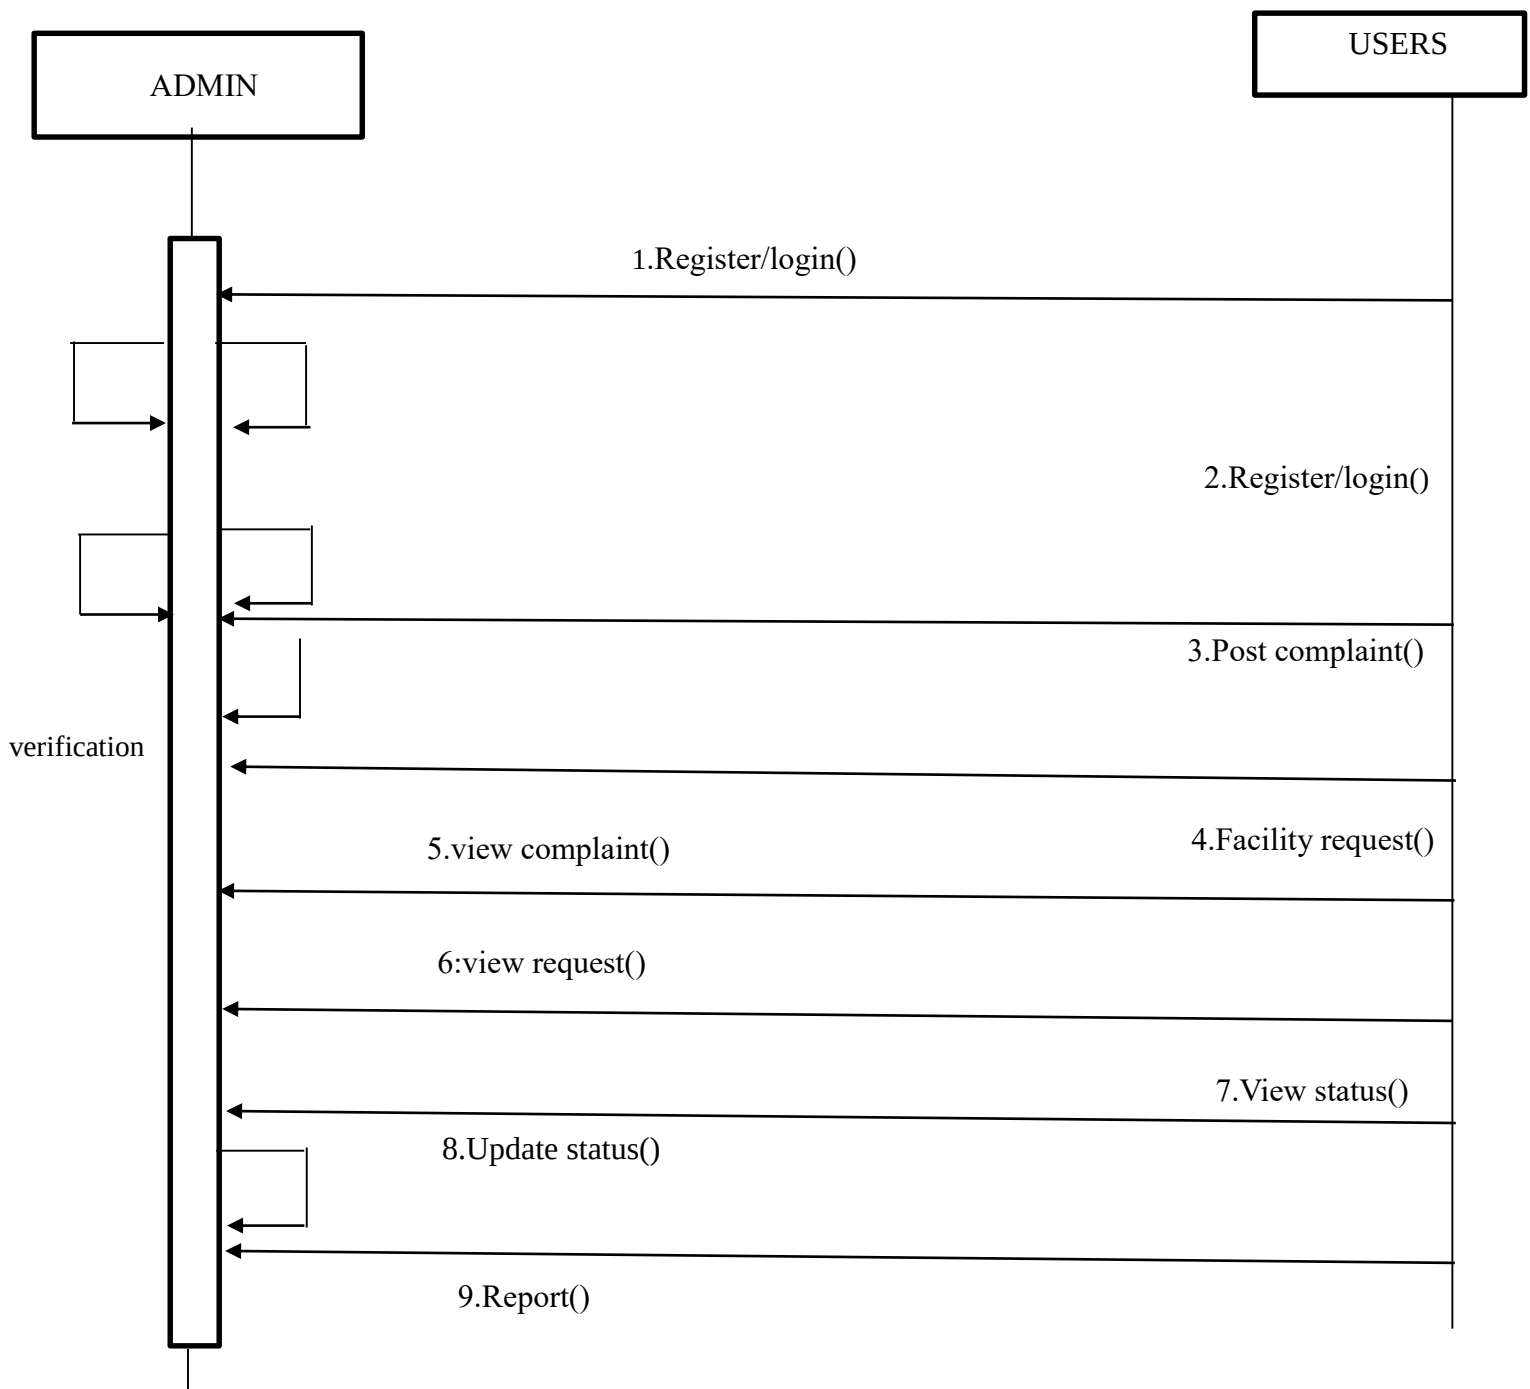

Fig.No.7.1.4. sequence diagram for Grievance Redressal system

7.1.5 COMPONENT DIAGRAM

A Component diagram shows object interactions arranged in time sequence. It depicts the objects and classes involved in the scenario and the sequence of messages exchanged between the objects needed to carry out the functionality of the scenario. Component diagrams are typically associated with use case realizations in the logical view of the system under development.

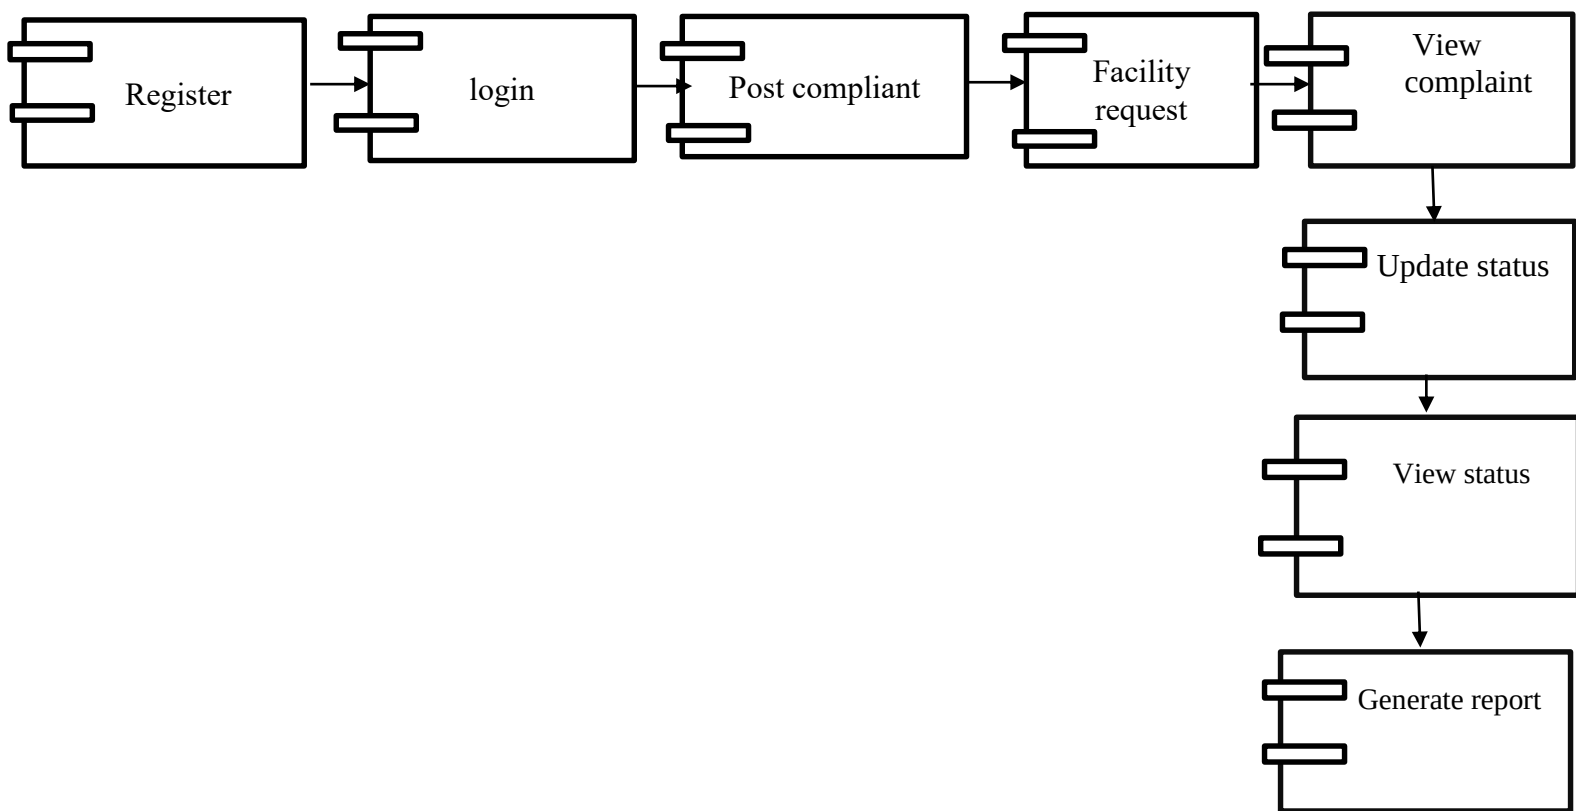

Fig.No 7.1.5 component diagram for Grievance Redressal system

7.1.6 DEPLOYMENT DIAGRAM

A Deployment diagram shows object interactions arranged in time sequence . It depicts the objects and classes in the scenario and the sequence of messages exchanged between the objects needed to carry out the functionality of the scenario . Deployment diagram are typically associated with use case realization in the logical view of the system .

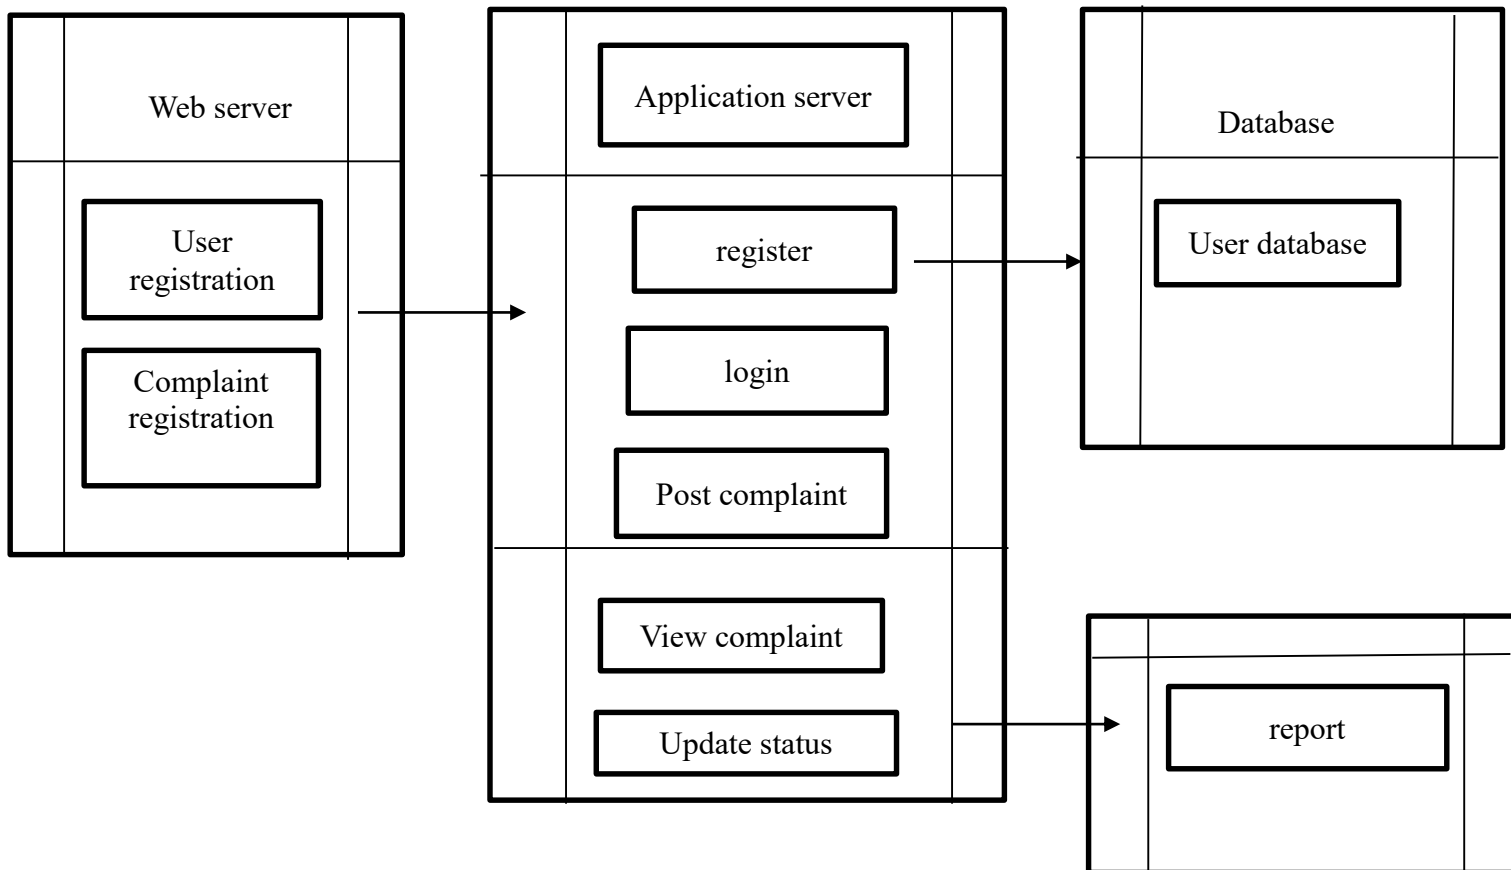

Fig.No. 7.1.6 Deployment diagram for Grievance Redressal system

7.2 .DATABASE DESIGN

A table is a data structure that organizes information into rows and columns. It can be used to both store and display data in a structured format. For example, databases store data in tables so that information can be quickly accessed from specific rows. Websites often use tables to display multiple rows of data on page. Spreadsheets combine both purposes of a table by storing and displaying data in a structured format.

Databases often contain multiple tables, with each one designed for a specific purpose. For example, a company database may contain separate tables for users details. Each table may include its own set of fields, based on what data the table needs to store. In database tables, each field is considered a column, while each entry (or record), is considered a row. A specific value can be accessed from the table by requesting data from an individual column and row.

7.2.1 STUDENT:

Table name: Student Registration

Description: This table contains the details of the student

FIELD NAME	DATATYPE	CONSTRAINTS	DESCRIPTION
Student_id	INT(10)	PRIMARY KEY	Student ID
Student_name	Varchar(15)	NOT NULL	Student Name
Gender	Varchar(15)	NOT NULL	Gender
DOB	Date(10)	NOT NULL	Date of birth
Email_id	Varchar(20)	UNIQUE KEY	Email ID
Phone_no	INT(10)	UNIQUE KEY	Phone number
Department	Varchar(20)	NOT NULL	Department
Year	Date(10)	NOT NULL	Studying year
Register_no	Int(10)	NOT NULL	Register number
Password	Varchar(8)	NOT NULL	Password

7.2.2 STAFF :

Table name : Staff Registration

Description: This table contains the details of the staff

FIELDNAME	DATATYPE	CONSTRAINTS	DESCRIPTION
Staff_id	INT(10)	PRIMARY KEY	Staff id
Staff_name	Varchar(15)	NOT NULL	Staff Name
Gender	Varchar(15)	NOT NULL	Gender
Aadhar_no	INT(12)	NOT NULL	Aadhar number
Email_id	Varchar(15)	UNIQUE KEY	Email id
Phone_no	INT(10)	UNIQUE KEY	Phone number
Department	Varchar(20)	NOT NULL	Department
Designation	Varchar(20)	NOT NULL	Designation
Password	Varchar(20)	NOT NULL	Password

7.2.3 SUPPLIER:

Table name: Supplier Registration

Description: This table contains the details of the supplier

FIELDNAME	DATA TYPE	CONSTRAINTS	DESCRIPTION
Supplier_id	Int(10)	PRIMARY KEY	Supplier ID
Supplier_ Name	Varchar(15)	NOT NULL	Supplier Name
Gender	Varchar(10)	NOT NULL	Gender
Aadhar _no	Int(12)	UNIQUE KEY	Aadhar _no
Email _id	Varchar(20)	UNIQUE KEY	Email_ id
Phone_no	Int(10)	UNIQUE KEY	Phone number
Address	Varchar(15)	NOT NULL	Address
Password	Varchar(15)	NOT NULL	Password

7.2.4 COMPLAINT :

Table name: complaint table

Description: This table contains the details of the complaint

FIELDNAME	DATA TYPE	CONSTRAINTS	DESCRIPTION
Complaint _id	Int(10)	PRIMARY KEY	Complaint ID
Complainant _id	Int(15)	FOREIGN KEY REFRENECE TO Student(student _id), Staff (staff_ id), Supplier(supplier_ id)	Complainant ID
C _booking_ date	Date	NOT NULL	Complaint booking date
C _type	Varchar(15)	NOT NULL	Complaint type
C_ description	Varchar(25)	NOT NULL	Complaint description
C _solution date	Date	NOT NULL	Complaint solution date

7.2.5 COMPLAINT TRACKING:

Table name :Complaint tracking

Description :This table contains the complaint tracking.

FIELDNAME	DATATYPE	CONSTRAINTS	DESCRIPTION
Tracking_id	INT(10)	PRIMARY KEY	Tracking ID
Complaint_id	INT(10)	FOREIGN KEY REFERENCE TO complaint table(complaint _id)	Complaint ID
Complainant_id	INT(10)	FOREIGN KEY REFRENECE TO Student(student _id), Staff (staff_ id), Supplier(supplier_ id)	Complainant id
Status	Varchar(20)	NOT NULL	Complaint Status

CHAPTER 8

SYSTEM TESTING

8.1 TEST PLAN

Testing is a process of executing a program with the interest of finding an error. A good test is one that has high probability of finding the yet undiscovered error. Testing should systematically uncover different classes of errors in a minimum amount of time with a minimum amount of efforts.

Two classes of inputs are provided to test the process

A software configuration that includes a software requirement specification, a design specification and source code.

A software configuration that includes a test plan and procedure, any testing tool case and their expected results.

Testing is divided into several distinct operations:

1. UNIT TESTING

Unit test comprises of a set tests performed by an individual program prior to the integration of the unit into large system. A program unit is usually the smallest free functioning part of the whole system. Module unit testing should be as exhaustive as possible to ensure that each representation handled by each module has been tested. All the units that makeup the system must be tested independently to ensure that they work as required. During unit testing some errors were raised and all of them were rectified and handled well. The result was quiet satisfactory and it worked well.

2. INTEGRATION TESTING

Integration testing is a system technique for constructing the program structure while at the same time conducting tests to uncover errors associated with interfacing. The objective is to take unit tested modules and build a program structure that has been dictated by design. Bottom-up integration is the traditional strategy used to integrate the components of a software system into functioning whole.

Bottom-up integration consists of unit test followed by testing of the entire system. A sub-system consists of several modules that communicated with other defined interface. The system was done the integration testing. All the modules were tested for their compatibility with other modules.

All the modules coexisted very well, with almost no bugs. All the modules were encapsulated very well so as to not hamper the execution of other modules.

3. VALIDATION TESTING

After validation testing, software is completely assembled as a package, interfacing errors that have been uncovered and corrected and the final series of software test; the validation test begins. Steps taken during software design and testing can greatly improve the probability of successful integration in the larger system.

TEST PLAN ID	TEST MODULE	TYPE OF TESTING	TEST DESCRIPTION	DURATION	REMARKS
TP1	Login	Validation Testing	To do the validation For testing the register number and password	3 Hours	Success
TP2	Registration	Unit Testing	Check whether the User registration details are stored in the database	3 Hours	Success
TP3	User details	Unit Testing	To modify and update the user details in the database	3 Hours	Success
TP4	View complaint	Unit Testing	To view and search the complaint	3 Hours	Success
TP5	Update complaint	Unit Testing	To update the complaint in the website.	3 Hours	Success
TP6	View complaint Solution	Unit Testing	To view the complaint solution in the website.	3 Hours	Success

8.2 TEST CASE

A test case has components that describe input ,action and an expected response. In order to determine if a feature of an application is working correctly .A test case is a set of instructions on "HOW " to validate a particular test objective/target ,which when followed will tell us if the expected behavior of the system is satisfied or not.

Characteristics of a good test case:

- Accurate :Extracts the purpose.
- Economical :No unnecessary steps or words.
- Reusable :can be reused if necessary.

LOGIN

TESTCASE ID	TEST PLAN ID	TEST CASE NAME	ACTUAL INPUT	ACTUAL OUTPUT	EXPECTED OUTPUT	STATUS
TC1	TP1	To do the Validation for testing the regno and password	Correct regnumber and password	System Displays the user homepage.	System displays the user homepage	pass
TC2	TP2	To do the Validation for testing the regno and password	InCorrect regnumber and password	System Displays the user homepage.	InCorrect regnumber and password	Fail

REGISTRATION

TESTCASE ID	TEST PLAN ID	TEST CASE NAME	ACTUAL INPUT	ACTUAL OUTPUT	EXPECTED OUTPUT	STATUS
TC3	TP3	Register a new student	Student basic Details	Stored all the details In the databases	Stored all the details In the databases	Pass
TC4	TP4	Register a new staff	Staff basic details	Stored all the details In the databases	Stored all the details In the databases	Pass
TC5	TP5	Register a new supplier	Supplier Basic details	Stored all the details In the databases	Stored all the details In the databases	Pass

USER DETAILS

TESTCASE ID	TEST PLAN ID	TEST CASE NAME	ACTUAL INPUT	ACTUAL OUTPUT	EXPECTED OUTPUT	STATUS
TC6	TP6	Register a new student	Student basic details	Stored all the details In the databases	Stored all the details In the databases	Pass
TC7	TP7	Register a new staff	Staff basic details	Stored all the details In the databases	Stored all the details In the databases	Pass
TC8	TP8	Register a new supplier	Supplier Basic details	Stored all the details In the databases	Stored all the details In the databases	Pass

VIEW COMPLAINT

TESTCASE ID	TEST PLAN ID	TEST CASE NAME	ACTUAL INPUT	ACTUAL OUTPUT	EXPECTED OUTPUT	STATUS
TC9	TP9	View the complaint	Open the View complaint page	Complaint Along with the details are displayed.	Complaint details to be displayed.	Pass

UPDATE COMPLAINT

TESTCASE ID	TEST PLAN ID	TEST CASE NAME	ACTUAL INPUT	ACTUAL OUTPUT	EXPECTED OUTPUT	STATUS
TC10	TP10	Update the Complaint	Open the Update complaint page	Complaint Along with the details are displayed.	Complaint details to be displayed.	pass

VIEW COMPLAINT SOLUTION

TESTCASE ID	TEST PLAN ID	TEST CASE NAME	ACTUAL INPUT	ACTUAL OUTPUT	EXPECTED OUTPUT	STATUS
TC11	TP11	view the complaint solution	Open the view complaint solution page	View Complaint solution details are displayed.	Complaint details to be displayed.	Pass

8.3 BUG REPORT

Bug report providing any important information uncovered by the tests accomplished and including assessments of the quality to the testing effort . The quality of the software under test and statistics derived from incident reports.

BUG ID	TEST CASE ID	TESTPLAN ID	BUG DESCRIPTION	BUG STATUS	OUTPUT
BR1	TC2	TP1	User enter incorrect regno or password.It Displays the user home page.	High priority	Success

CHAPTER 9

CONCLUSION

The project report entitled ” **Online Grievance Redressal System For An Educational Institution**” has come to its final stage. The system has been developed with much care that it is free of errors and at the same time it is efficient and less time consuming . The important thing is that the system is robust . We have tried our level best to make the site as dynamic as possible. Also provision is provided for future developments in the system. The entire system is secured . This online system will be approved and implemented soon . More than anything this project has given us great satisfaction in having designed an application , which processes information from university to the students. This system transfers the user’s needs into a software solution and saves their precious time . This online system can be approved by the college and if it is implemented it will be much useful for student . There is a scope for further development in our project in terms of functionality for users . The admin can track each user by their register no, and can be provides only their specific details . With this project so that it becomes a single stop for the students.

CHAPTER 10

FUTURE ENHANCEMENT

This application is developed in such a way that any future enhancements can be done easily. This project has a vast scope in future.

- This application is created only for one state. In future, this can be expanded to multiple states.
- Web based application can be developed for this system.
- The system can be upgraded by including more features like SMS facilities etc.
